

Asynchronous Vectorial Motors

MQ series

Frames 100 - 500 / from 2.5 to 3600 kW

EN

A dynamic, strong and ambitious Group:

Orange1 Holding is an international renown Group, one of the most important European manufacturers of single-phase and three-phase asynchronous electric motors. It has an annual capacity of more than 1 million motors and 5 million electric stators with an annual turnover of approx 200 million euro and more than 1200 workers in 11 production facilities. The group, established in 1971 by Leone Donazzan, chaired today by his son Armando Donazzan, is strongly focused on technological innovation, performance and customization to meet individual clients requirements. As a group of 13 companies it has a powerful advantage: the strength in numbers.

THE PANTHER

A fast, sharp, animal, able to achieve its goals thanks to intuition, instinct and greater response capacities. An excellent predator.

2017

200 million turnover

Timeline

WE ARE PASSION

We look to the future,
to anticipate customers' needs.

Soul, Heart and Brain striving to create real value to our customers and to ourselves. Our principal motto is "We Are Passion" in order to win the most passionate challenge: anticipate customers' needs.

With its mission the company try to create real value to the customers by considering their perspectives and realizing their expectations. Orange1 Holding defines itself as a "Manufacturer of Solutions".

How to ride through time? Orange1 tries to move with the time acting without hesitation in order to be constantly at the cutting edge of development in its sector.

RESEARCH & DEVELOPMENT

The R&D Department
is a strategic advantage for the Group.

The design and development of new products is a crucial factor in such a changing industrial society considering the technological innovations and the competitors.

Corporate strategies and choices are extensive technological research, desire to emerge and a high level of originality. Orange1 products suit customers and market needs despite the high level of personalization.

The launch of a new product is the conclusion of a thorough market analysis. By focusing on the flexibility and efficiency Orange1 Group responds to customers' demands designing customized models for special applications.

This has allowed a notable technological and production development.

MAGNETIC MOTORS srl designs and manufactures a wide range of variable speed electric motors. The current proposal of unique and state-of-the-art technology solutions is the result of a continuous research process carried out internally by a highly qualified technical staff and collaboration with prestigious Italian Universities. MAGNETIC MOTORS srl is also specialized in custom-made products suitable for every kind of application.

Sicme Motori is a LEADING manufacturer of AC-DC motors and generators, vaunting more than 50 years of ENGINEERING know-how applied to new technologies, innovation and customised solutions.

Its activity dates back to 1967, when firstly started to design and produce customised electric motors for industrial applications. Since then its ability to focus on continuous technology development and provide high quality motors has led to increasingly success, proven by todays' facts and figures.

Asynchronous vectorial motors MQ series

Application fields

Cable transport
Cranes
Sheet metal working machines
Machine tools
Plastic extruders
Blowing machines
Woven wire manufacturing machines
Presses
Industrial washing machines
Amusement rides
Thread/cable manufacturing machines
Converting
Steel/copper cable working machines
Board working machines

Asynchronous Vectorial Motors

MQ series

The asynchronous motors MQ series have been specially engineered to achieve reduced dimensions, high performances in variable speed applications with flux vector type controllers. They were born due the great experience of two important companies in the field of industrial automation: Magnetic Motors e SicmeMotori. The main feature is in the laminated stator pack which carries out the functions of the frame and integrates the air circulation system. In particular, these motors, even though they are sensibly more compact, make it possible to achieve very high specific powers with regard to a standard motor with the same shaft height. The distinctive electromagnetic and mechanical design permits operation in constant power mode at maximum speeds of up to 8000 RPM. The efficient stator cooling system uses an auxiliary electrofan to combine the benefits of reduced dimensions and high, continuous, low-speed torque capability.

MAIN CHARACTERISTICS

They are three-phases asynchronous motors with squirrel-cage, low losses laminated sheet with square frame visible from external of motor, a compact structure independent electrofan to obtain the following characteristics:

- High power with relation to the external size
- Small external dimensions
- High rotation speed (up to 8000 rpm)
- Maximum and continuous torque are available even at low speed
- Small moment of inertia of the rotor
- Degrees of protection IP54 and IP23
- Dimensional and power comparability with direct current motors.
- Ventilation and speed transducer incorporated in the motor structure
- High mechanical robustness
- High precision of rotation speed
- Insulation class F (CEI EN60034-1)

They are available with 10 different shaft height (frame size 100-132-160-180-225-280-355-400-450-500 mm) with power ranging from 2,5 to 3600kW. In addition the MQ motors can also be manufactured with larger shaft height sizes on customer's request.

Standard mechanical protection degree available are: closed solution in IP 54 and an open solution in IP 23. Other solution upon request.

The cooling of the motor is provided by an axial or radial electric fan, mounted in the rear of the motor (no drive end side of coupling).

Motors frames 280-500 mm and upper are available with air-water IC86W or air-air exchanger IC666.

All standard selection of accessories or on request, include more common thermal protection detector (PTC, PT100, Klixon etc).

As an option, motors frames 100-280 mm can be equipped with a parking brake.

The whole series is dimensioned in F class; during CEI S1 service the max. overtemperature allowed is therefore 105°C. Notwithstanding this, in order to increase the machine reliability, almost all the insulating materials are in class H (Δt max 125°C, absolute max. foreseen temperature 180°C). The impregnation is always made under vacuum to guarantee the resin penetration.

The winding is made of copper foreseen with special enamel to resist to the peaks generated by the inverter (high voltage variations, dv/dt). In any case it is advisable to contain the PWM frequency and to check that there are no refraction phenomenons on very long power supply cables (high voltage peaks and dv/dt) considering the opportunity of using suitable solutions (for example to insert filters or chokes between inverter output and motor armature).

Further series of machines for completing the offer for special applications are also proposed:

- Serie A

These motors have a low moment of inertia to achieve high dynamic performances.

- AW Series

These motors integrate a liquid cooling system for low noise applications and when it is necessary a high protection and/or to reduce the dimensions.

Operations

The main formulas that regulate the operations of the asynchronous motor are:

$$n_s = \frac{60 \times f}{p}$$

*n_s synchronous speed [Rpm]
(it differs from the real speed only at load condition)*

$$f$$

f supply frequency

$$F = \frac{E}{f \times K}$$

F N° of poles pairs (2 in this case)

$$E$$

E magnetic flux [Wb]

$$T = F \times I_R$$

T induced voltage [V]

$$T$$

T machine constant (winding turns, ...)

$$I_R$$

I_R Torque [Nm]

I_R rotor current [A]

In the operations at constant torque (until the nominal speed, nn) the motor flux is maintained constant (in the same way as in the D.C. motors) so as to maximize the torque constant and to obtain a system ready for the load change. In order to obtain this the E/f ratio is maintained constant therefore the torque depends directly from the rotor current. It is necessary to point out that "E" voltage is not the power supply voltage of the motor but differs from this in the voltage drop due to the resistance and to the stator leakage inductance.

The upper speed limit of this operation mode is determined by the voltage available from the converter beyond which the E/f ratio cannot be kept constant and consequently the flux decreases.

The operation range besides the nominal speed is named "field weakening zone" for the flux reduction due to the frequency increase without the relative increase of the voltage. As indicated below between nn and n1 the nominal power of the motor is available: the flux decreases when the speed increases but at the same time even the load torque decreases in the same way. From the mentioned relations you can note that the rotor current remains constant as well as the induced voltage of the machine. The voltage at the motor does not remain constant but increases especially at high field weakening ratio: it is logical consequence that the value of n1 is defined from the value of available voltage.

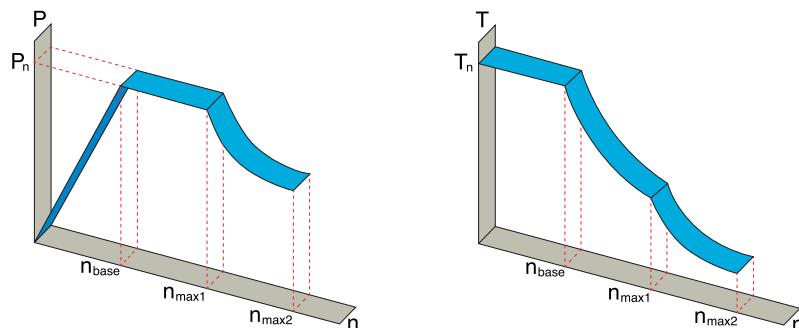

In the following data sheets, the voltages 3x360V, 3x400V and 3x690V have been considered as the value usually available. Over n1 and up to the absolute speed limit defined from nmax, a reduced power is available. The value is

$$P = P_n \times n_1 / n$$

where n= chosen speed

This is due because the maximum torque of the motor is related to the mutual of the square of the flux and therefore, during the flux weakening, this value decreases much and over n1 causes a power derating. It is necessary to take care in the high field weakening ratios (>4) as, due to the complexity of the calculation algorithm, it can result harder to control with accuracy the motor-converter system .

In the following tables it is considered a mains voltage of 3x400VRMS and two different output voltage values available from the inverter to the motor according to the type of modulation adopted: 3x360VRMS and 3x400VRMS. In the first case (360V) windings of 345V (nominal voltage) are defined for high dynamic applications and/or wide range of constant power speed regulation; in the second case (400V) windings of 380 up to 400V are defined for generic applications without overload near nominal speed and constant power speed regulation. As the second ones and for big motors, there are tables referred to 3x690VRMS of mains and 3x690VRMS available from the inverter. All the characteristics showed depend on this value so it is important that the voltage available from the inverter output is compatible with the above mentioned values.

Permissible overload in the constant torque speed regulation (<nn) is reported in the following tables, max torque decreases near the nominal speed due to the reduced voltage margin.

At speed higher than nn, the overload margin decreases to zero at n1: curve of the picture between n1 and nmax shows power output limit due to the voltage supplied by the inverter. However, the RMS power must not exceed the nominal value Pn.

Environment condition for operation

The three-phase motor MQ series are designed to satisfy the performance reported on the datasheet in standard conditions of temperature (-15 °C ; +40 °C) and altitude (0 - 1000m asl).

Other different operation conditions, must be analized.

It is assumed that the environment in which our machines are installed is not critical. The correct situation is:

Dry, i.e. with relative humidity of the air below 75%.

Clean, i.e. without appreciable quantities of dust and dirt in general suspended in the air.

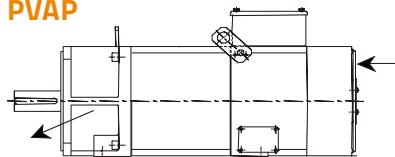

Free from aggressive chemical agents, i.e. without concentrations of gas or vapours that could chemically harm the copper, iron, aluminium, paints and insulation.

These motors can also be installed in difficult environments (damp, dusty, chemically harmful, etc), but in this case the degree of protection, method of cooling and possibly the choice of materials must be previously agreed upon.

Solutions for ventilation and protections

Motors foresee an independent auxiliary ventilation systems as following types:

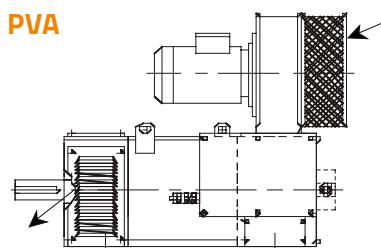

PVAP

MQ 100+180 with IP54 protections and PVAP execution.

The standard version of the whole series foresees an axial fan rear mounted on the same axis as the motor. The powers are those indicated in the tables.

PVA

MQ 180+280 in IP54 protections and PVA execution.

A centrifugal fan mounted radially to the motor is foreseen. The powers are those indicated in the tables.

MQ 100+280 in IP23 protections and PVA execution.

A centrifugal fan mounted radially to the motor is foreseen. The execution with protection reduced to IP23 allows a considerable increasing of the power for the same size.

Other solutions are available upon request.

In the following some solutions are described as examples:

IP23 PVAP2 version

a centrifugal electrofan is mounted in the rear of motor to minimize the radial overall dimension.
The feature are the same of IP23 PVA solution

SAH version(only for 315-500 framesize)

the cooling is foreseen by an heat exchanger air-water. It improves the protection up to IP54.
The feature are the same of IP23 PVA solution.

Performance

**The data and powers shown
in the technical tables refer to the following
power supply and operating conditions:**

Duty	Continuous running duty S1 according to IEC 34-1, CEI EN 60034-1 Standards (for different duty cycles, please check C.03)
Ambient temperature	Max 40°C.
Temperature rise (Class F)	According to IEC 34-1, CEI EN 60034-1 Standards.
Altitude	Max 1000 m above sea level.
Overloads	Admitted in S1 duty conditions, obviously complying with the catalog and name-plate data of the motor: 60% with a maximum time of 15 seconds and repeat events with a minimum interval of 10 minutes.
Power supply	Inverter power supply with voltage and frequency corresponding to the nominal data of the motor.

BEWARE: performance is guaranteed at the rated supply voltage as per the value in the head of tables.
Please, pay attention to these details before purchasing the motor; we can offer motors with specific voltages,
for special requirements.

Key-words

Motor	Wind code	Nominal speed	Nominal power	Nominal torque	Maximum torque	Inertia	Nominal voltage	Nominal current	Nominal freq.	Maximum speed at Pn	Maximum speed	Weight
		nn [RPM]	Pn [kW]	Mn [Nm]	Mmax [Nm]	J [kgm ²]	Vn [VRMS]	I _n [ARMS]	F _n [Hz]	n ₁ [RPM]	n _{max} [RPM]	W [kg]

nn	Nominal speed
Pn	Nominal mechanical power at the shaft for service factor S1
Mn	Nominal torque at the shaft
Mmax	Maximum output motor torque
J	Rotor inertia
Vn	Motor nominal voltage
I _n	Nominal current
F _n	Nominal power supply frequency
n ₁	Maximum speed at constant power (Pn) without voltage increase between nn and n ₁
n _{max}	Maximum mechanical speed not in continuous duty
W	Motor weight

Attention:

Electrical data and performances are indicative and can be changed without notice.
The maximum continuos value of speed is 70% of max speed (n_{max}) and it is referred to the standard execution (low radial loads). Other bearing solution have different values of speed.

The value in blues of frequencies are only indicative

Degree of protection: IP54
Cooling: IC416
Supply voltage from inverter: 3x400VRMS

IM Mounting arrangements

The motors can be manufactured in the mounting arrangements indicated in the following table, according to the IEC 60034-7 and CEI EN 60034-7 Std.

Special flanges are available on request.

The standard supply of vectorial motors concerns IM1001 (B3) form.

For other constructive forms and for mounting with vertical axe, please ask our sales Dpt.

Motors with feet			Motors with through holes flange		
IM B3 IM1001	IM B6 IM1051	IM V6 IM1031	IM B5 IM3001	IM V3 IM3031	IM V1 IM3011
Motors with feet			Motors with feet and through holes flange		
IM B8 IM1071	IM B7 IM1062	IM V5 IM1011	IM B35 IM2001	IM V36 IM2031	IM V15 IM2011

In IM B5 execution it is necessary to use a support under the opposite side shield for the longer lengths.

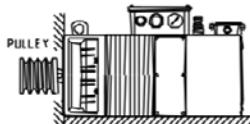

If it is not possible to provide the support, please contact our sale Dpt. for other mechanical solutions.

In the following table, standard and optional configurations of MQ motors are shown, according to the type of coupling to the load (coupling or pulley)

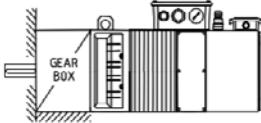

RECOMMENDED MOUNTING POSITIONS						
C COUPLING	1	2	3	4	P PULLEY	
B 35 	B 3 	B 5 	B 5 + supp 			
FRAME	K	S	M	L	P	X
80		C or P ...1,2,3,4			C ...1,2,4 - P ...1,4

Transmission

**Follow the notes below
for a proper motor selection**

For application with pulley, the DE roller bearing option is required,
see paragraph of 'Bearings for high radial loads'

For applications with hollow shaft gearbox (without flexible coupling)
the precise flange option is necessary.
In this case, choose the ball bearing solution for DE side..

Bearings: standard execution

As standard there are rigid radial ball bearings on both sides and one of these bearings is axially locked.
The bigger frame sizes (400, 450 and 500) have a roller bearing on drive end side and a ball bearing on the opposite side.

Type	Standard bearings

AJ = low inertia version - AW = water cooled version

Bearings: solutions for high radial loads

On request, special bearings (roller) can be mounted on the drive side (see table). For the motors supplied with the roller bearing option, the maximum speed datum (n_{max}) must be reduced due to the lower maximum speed allowed by this typology of bearings. Furthermore, a minimum radial load is required to assure a correct working.

For further details, please ask our sales Dpt..

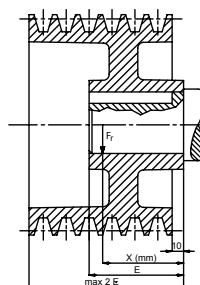

Maximum radial loads that can be applied at the motors shaft ends are shown on the table. These values are for air cooled motors and the figures are approximated. For critical cases, please always contact us directly. These values are referred to a maximum life of the bearings, calculated according to ISO 281, of ≥ 20.000 hours of continuous operation at indicated speed. Data and operating hours are calculated for normal operating conditions, without vibrations and with temperatures within the limits imposed by the bearing manufacturers. It is therefore possible that, in some operating conditions, the life span of the bearings could be shorter.

Type	DE bearings	Max continuous speed g/1' - rpm	Max speed g/1' - rpm	Distance X mm	Max radial load Fr (1) N

please ask our sales dpt

(1)Value referred to 1500RPM, over this speed the admissible radial loads decreases: please ask our Sales Dpt.

**To calculate the radial load
please see the following method:**

$$Fr = 2040 \times \frac{C}{D} \times k$$

where:

Fr radial load in [N]

C motor torque in [Nm]

D pulley diameter in [mm]

k tensile factor specified by pulley manufacturer and corresponding about to:

k=1 for toothed belts

k=2.3 for trapezoidal belts

k=3.8 for flat belts

Ventilation and electrofan characteristics

There are three-phase electrofans whose characteristics depend on the ventilation system adopted.

The following table shows the characteristics of the standard cooling fans. Other supply conditions can be provided upon specific request.

Motor type	Cooling type	Phases	Power kW	Frequency 50 Hz			Frequency 60 Hz			Air flow m3/sec	Pressure Pa

NOTES:

1) When ordering, it is necessary to define the fan voltage (connection Y or Δ) since the connection cannot be modified later.

2) Different electrofans are foreseen for 50Hz and 60Hz.

Y/Δ) It indicates when the connection star-delta is possible inside the terminal box

Other supply characteristics are available upon request

IP23 motors are supplied with a filter for the inlet air.

IP54 motors with radial fan are supplied with a filter for the inlet air on frame sizes 132-280. For bigger frame sizes, it can be supplied upon request.

Thermal protectors

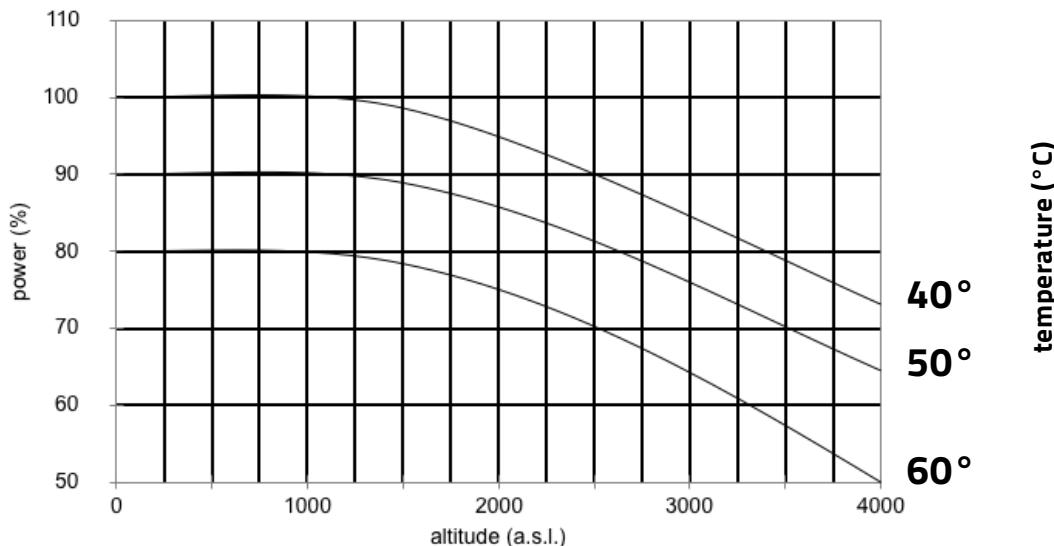

As standard, the thermal protection of the motor is carried out through 3 bimetallic (PTO) thermal protectors, connected in series and incorporated in the windings.

Other types of thermal protectors or temperature probes (PTC - PT100, etc.) are available on request.

Cooling of the motors, ambient temperature and altitude of installation

The power/torque values indicated on the catalogue are referred to the motor shaft, for continuous duty, max ambient temperature 40°C, altitude not higher than 1000 m.a.s.l., inverter supply. For different environmental conditions, the power varies as follows.

Motors derating according to temperature and altitude of installation

Painting

The standard finish includes pre-treatment with two-component epoxy primer which is suitable for any other finish paint. Special paint finishes can be provided upon request.

Standard rules

MQ motors are manufactured in fully accordance with standard CEI EN60034-1 and they comply with IEC 34-1, therefore in accordance with the rules of the principal European countries.

All the motors in this catalogue satisfy the requisites of the following Directives
-2014/35/EU Low Voltage Directive

Reference has also been made to the following directives within the limits as per the following description:
-EMC 2014/30/EU (Electromagnetic Compatibility) Directive
-Machine Directive 2006/42/CE

The electric motors/generators are components that are incorporated into other machines, systems and plants, therefore the resulting EMC behaviour is under the responsibility of the Manufacturer of the machine or plant incorporating the motor/generator. With reference to the 2006/42/EC Directive, it must be specified that the motors/generators must be installed in compliance with the installation instructions and cannot be put into service until the machine in which they are incorporated has been declared in compliance with the 2006/42/EC Machinery Directive.

Balancing of the rotor and vibrations

Shaft is supplied with full key (but balancing is carried out with half key, according to ISO 2373).

The degree of vibration complies to the A class (equivalent to old R class) in order to guarantee low vibrations even at very high speeds. On request, for special applications, it is possible to balance the rotor according to B class (equivalent to old S class) or to balance it with full key.

The vibration values indicated in the following table refer to the IEC 60034-14 and CEI EN 60034-14 Std.

The maximum vibration level is expressed in mm/s RMS and it is valid for the free suspension measuring method or for motor placed on rubber (Free Suspension) and clamped directly to a solid floor (Rigid mounting). The classification is carried out by balancing class, rotation speed and shaft height.

Max. effective value of vibration

Class	Mounting	H ≤ 132 mm/s	132 < H ≤ 280 mm/s	280 < H ≤ 500 mm/s
A*	Free suspension	1.6	2.2	2.8
	Rigid mounting	1.3	1.8	2.3
B	Free suspension	0.7	1.1	1.8
	Rigid mounting	-	0.9	1.5

* Classe standard di equilibratura / Standard balancing class

For speed higher than 3600RPM, refer to rigid mounting values/conditions.

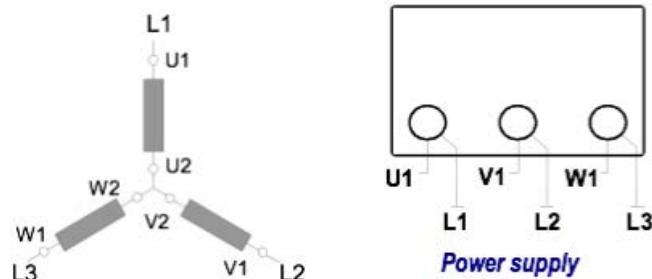

Terminal box and terminal board

The electrofan motors have a separate terminal box or a dedicated connector for MQ100/MQ133/MQ160 IP54-PVAP. All terminal boxes are supplied already drilled, with plugs (the Customer will have to replace them according to its own needs).

Standard position is showed on the overall dimension drawing.

Different positions are available on request, compatibly with the mechanical structure of the motor: in this case, please ask our sales Dpt..

STANDARD CONNECTIONS (STAR)

Speed transducers (Encoder)

Normally, a hollow shaft transducer is used, in order to reduce the dimensions and guarantee a perfect mechanical connection with the shaft.

The body of the transducer is fixed to the back cover of the motor and it has the possibility to oscillate by means of a reaction arm which has the task to absorb possible axial/radial misalignments.

All the transducers are provided with circular connector.

The motor can be supplied complete of one of the following transducers:

1 1024 1) ppr; incremental signals A, -A and B, -B ; zero pulse, power supply 5VDC or 5+32VDC; electronic output: TTL (5VDC) or HTL (5+32VDC like power supply)

2 Sine/Cosine 1 period absolute Waves/rev.; 2048 ppr incremental signals A, -A and B, -B zero pulse; power supply 5VDC; electronic output: sine-cosine 1Vpp

1) giro 1024 is the standard optimized solution, other numbers of ppr are available upon request

Different transducers provided by the Customers can be installed if they are compatible with the mechanical structure of the motor.

Type and Routine tests

Type tests are carried out on the first motor of a series, and then the values revealed are used as reference during the routine tests of the following ones having same characteristics.

We use test benches equipped with frequency converters, in order to test the motors at the speed and frequency that will be used by the customer; moreover, procedures and measuring equipments are compliant with the last regulations about variable frequency and PWM.

All motors and components are subjected to routine tests during the manufacturing and at the end of the production cycle.

Accessories

Hereafter the most common options available upon request:

UL Certification

The MQ asynchronous motors can be provided with insulation system compliant with UL (1004, for rotating electrical machines). Some frame sizes are available with UL certification of complete motor.

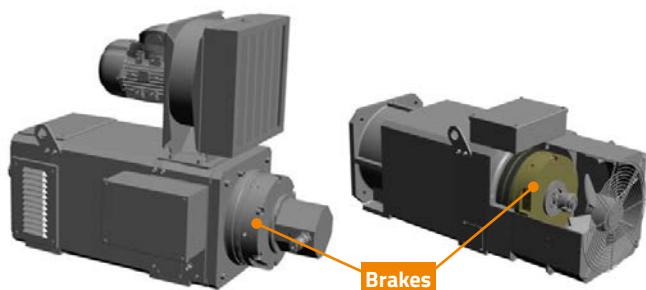

Beware: not all the accessories are available with this marking. Therefore we kindly ask you to get in contact with our sales Dept. for a feasibility evaluation and relative quotation.

Brakes

The motor complete with an holding/emergency brake is available on request for 100-280 framesizes. This auxiliary brake is of electromechanical type with springs, low inertia with braking action in case of loss of supplying, it has a strong structure that allows a good heat dissipation.

It is inside the motor on MQ 100-160 IP54, outside for the other framesizes/solutions.

Motor	Brake Model	Static Braking Torque	Max Speed of the motor	Power supply	Input Power	Additional moment of inertia	Max energy at 1 insert./hour	'L' dimension increasing	Additional weight

- 1) ATTENTION: for vertical mounting (V1, V3, etc.) please contact our sales office.
- 2) Other brakes with higher speeds are available on request.
- 3) Necessary power to release brake is inside bracket

The brake during its operation generates heat according to the inertia to be braked and to the rotation speed. It is therefore important to check that the energy generated by the brake during the braking does not exceed the limit indicated in the table. The energy (L) is given by the following equation:

$$L = \frac{(J_m + J_f + J_c) \times n^2}{1824}$$

J_m = inerzia motore	<i>motor inertia</i>	(Kg/cm ²)
J_f = inerzia freno	<i>brake inertia</i>	(Kg/cm ²)
J_c = inerzia carico	<i>load inertia</i>	(Kg/cm ²)
n = velocità	<i>speed</i>	(RPM)
L = Lavoro	<i>energy</i>	(kJ)

If the number of insertion per hour is higher than 1, max. dissipable energy decreases according to the number of insertion, therefore for particular requirements please contact our sales Dpt.

Anticondensation heaters

Anticondensation heaters are recommended and/or prescribed for machines installed in environments with high humidity or great fluctuation of the temperature. These are also foreseen for closed motors (IP54, IP55), if there is any risk of condensation inside the motor. The heating elements must be used only when the machine is not running. They must be disconnected when the motor is powered. Standard power supply is 1-ph, 230V, 50/60 Hz.

Ventilation failure detector

On request on motors with radial fan a ventilation failure detector can be supplied, to check the efficiency of the cooling system. This device is set in our testing room and the adjustment screw is sealed to prevent tampering.

Tropicalization

The treatment for tropicalization of windings consists of an additional painting with varnish containing mildew-preventing additives. This treatment is recommended for machines installed in environments with high humidity or great fluctuation of temperature.

Bearing temperature control sensor

On request a PT100 heat detector can be installed to check the bearings temperature.

Insulated bearings

On request electrically insulated bearings having external insulating coating or ceramic balls are available. This insulation stops the major part of shaft-current. Normally the insulated bearings are mounted on the non drive end.

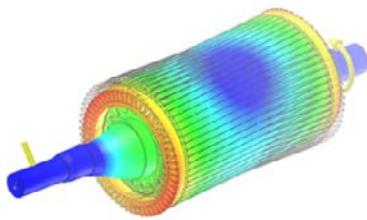

Rotor earthing system

On request, brush for rotor earthing to prevent damages to bearings due to Eddy currents can be supplied. Attention: brush for rotor earthing is not foreseen in all solutions; please contact our sales Dpt for an evalutation.

Special tests and/or witnessed tests

These can be carried out in accordance with the equipment existing in the factory and according to the agreements established when ordering.

Solutions with higher speed

Our Company is able to satisfy specific customer's requests. Thanks to our R&D department in which a lot of resources are involved, the company is able to evaluate products with excellent dynamic characteristics, related with customer's machine/application, thanks to advanced analysis of the project (magnetic harmonics, ripple, structural, frequency, buckling).

Here below it is reported an example of an asynchronous motor with very remarkable deflux ratio and maximum speed.

Motor	Wind	nn rpm	Pn kW	Mn Nm	Vn V	In A	Fn Hz	n1 rpm	nmax rpm	Mmax rpm	J Kgm ²	W kg
MQ 355M IP23		1000	500	4775	625	640	50	3000	3000	12000	29.09.00	2700

Notes

This catalogue gives general information about all sizes of MQ a.c. motors. Customers can determine whether a specific product is suitable for their needs and are thus responsible for the selection, use and results obtained by any product cited in this catalogue. The information contained in the present catalogue does not guarantee the characteristics for the use. Products listed in this catalogue are exclusively designed and built for industrial purposes.

For particular cases in NON-industrial environments, or where other types of protection must be provided (for example against contact with children fingers, etc.), these guards or additional protections must be realized by the Customer.

Any non-observance of the rules for installation, use and maintenance or any modification/tampering with the motor makes the guarantee rights invalid and exempts manufacturer from any responsibility

Any use of the motor differently from the specifications indicated in this catalogue does not involve any liability of manufacturer.. The company reserves the right to modify at any time and without notice the data, the technical characteristics, the dimensions, the weights and the illustrations.

The company refuses all responsibility for direct or indirect damages caused by possible errors and/or omissions in the present catalogue. The reproduction, even in part, of the present catalogue must be authorized in writing by the company.

Low inertia Motors

Three-phase asynchronous motors with low inertia are designed and manufactured especially to meet high torque requirements and fast dynamics.

The motor is designed in order to minimize the inertia and to grant a high ratio between nominal torque and rotoric inertia values. These motors will allow very high accelerations and assure a dynamic functioning with little investement in terms of energy. Motor frame is square and done with laminated stator that integrates cooling ducts directly into the magnetic laminates. This leads to a very solid structure, compact and extremely efficient from the thermal point of view. Cooling system has been designed to allow its functioning also in hard environment conditions.

Electrical data and performances

Liquid cooled asynchronous motors AW series

The AW liquid cooled series asynchronous motors have been specially designed and manufactured to satisfy the need for high torque and high dynamic performance typical of some high performances application, in particular for application in harsh environments.

The main innovation is in the external aluminium structure which carries out the functions of the frame and integrates the cooling system, by the forced circulation of the cooling liquid.

These new motors give very high specific power output in relation to the size and the degree of the protection of the motor (IP55).

The motor, very compact and with a regular shape, makes the integration into the machine structure very easy and can be used with no derating even in particularly aggressive and harsh environmental conditions with extreme temperatures and contaminated air.

Main characteristics:

- **High power/torque density**
- **Reduced overall dimensions**
- **Modern design**
- **Small moment of inertia of the rotor**
- **Maintenance free**
- **High rotation speed**
- **Peak and continuous torque available even at zero speed**
- **High precision of rotation speed**
- **High protection and mechanical robustness**
- **Reduced number of components**
- **Optimized cooling system**
- **Cooling pipeline and speed transducer incorporated in the motor structure**
- **Perfect integration in the structure of the machine**
- **It can be used in aggressive environment**
- **Very quiet**

The AW VECTOR-SPEED motors are manufactured in 6 sizes with aluminium housing (100-132-160-180-225-280) and in 3 sizes with steel housing (250-280-355), with power ranging from 7.5 to 652kW at 1500rpm.

They are available with IP54, IP55 and IP56 protection degree.

The hollow shaft speed transducer is integrated within the structure of the motor in order to contain the size requirements.

As option, frames 100-225 can have parking brake.

The noise level of the AW VECTOR-SPEED motors are within the limits imposed by the IEC 60034-9 and CEI EN 60034-9 Std (measurement with sinusoidal feed). As they are liquid cooled, these motors are intrinsically very silent. Values are lower than 75dBA.

Sectors of use and fields of application

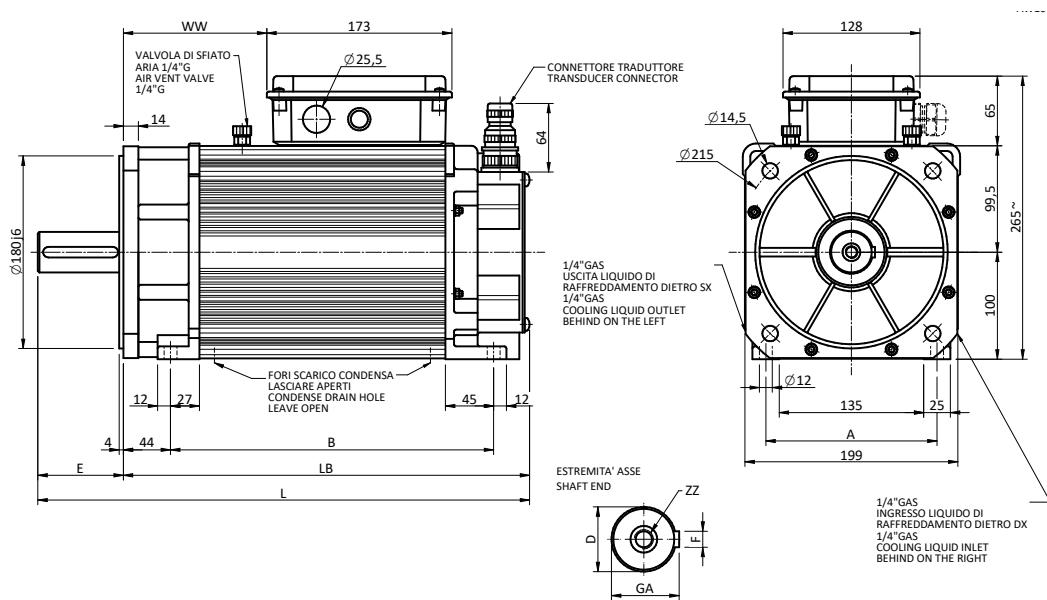

Typical fields of application:

- **Extruders for plastic, rubber and foods**
- **Metalworking machine**
- **Plastic injection machines**
- **Paper and cardboard production lines**
- **Machine tools**
- **Printing machines**
- **Systems for testing motors and transmissions**
- **Electric traction and propulsion**

Liquid cooling characteristics

AW motors are liquid cooled. The heat generated by the losses is dissipated through the motor mechanical structure, which integrates the heat exchanger (jacket or ducts where the liquid circulate).

The circulation of the liquid is assured by the electric pump of the customer cooling system (towers, evaporators or chillers) which also regulates the temperature.

The cooling system is IC9W7, according to IEC 60034-5 Standards. The table B.11.5 gives all information necessary to calculate the cooling system for the different motor frames.

Motor size	Size	100	132	160	180	225	280	355
Liquid delivery	l/min	8	10	12	15	18	24	30
Cooling capacity	kW				= Pn - (0,95 x Pn x η%)			
Max perm. pressure	Bar	3	3	3	3	3	3	3
Max pressure drop	Bar	0,5	0,5	0,5	0,5	0,5	0,5	0,5
Coolant temperature *				18°C (min. 16°C) at rated operation				
Type of coolant				Water + anticorrosion/no-frost additives (max 20%)				
Cooling circuit				Closed with external heat exchanger				
Derating coefficient				If t>18°C see graph				

*input temperature

Table B.11.5

The quality of the water in the cooling system is very important for a reliable service of the motor and in order to prevent costly maintenance operations in case the water racket becomes blocked.

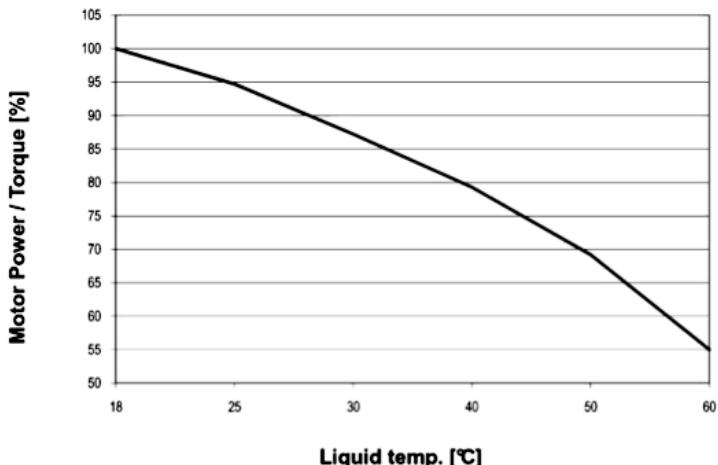

The temperature of the coolant must never drop below 16°C, to prevent condensate forming inside the motor.

Characteristics of the cooling liquid must be:

Water + Tyfocor (amb temp.-9°C)	20%
Water + Tyfocor (amb temp. -20°C)	35%
Ph	6...9
Total hardness – dH°	8...14
Chloride Cl – mg/l	<200
Sulphate SO42, - mg/l	<200
Oil – mg/l	<10
Permissible solid size – mm	<0.1

Power derating

The ideal temperature of the coolant is between 16°C and 18°C. Any coolant temperature over 18°C determines a decrease of the motor performances. Any coolant temperature under 16°C may cause condensation of the air inside the motor
